Global formalism

Input/output

- **Goal:** infer a function from an input (often tensor) space to an output (often tensor) space, $\mathbf{y} = f(\mathbf{x})$,
- **Example:** input can be an image, output a vector where the largest value indicate the category the image belongs to.

Error/Loss

- **Loss \mathcal{L} :** nonnegative measure of the discrepancy between expected output $\hat{\mathbf{y}}$ and obtained output \mathbf{y} .
- **Example:** output should be $[0, 1]$ but is $[0.2, 0.8]$.

Parameters

- $f = f_w$ contains **parameters \mathbf{W}** to be trained,
- In most cases, an ideal f_w exists but is **hard to find in practice**,
- Learning is a **regression ill-posed** problem.

- **Example:** input can be an image, output a vector where the largest value indicate the category the image belongs to.

Error/Loss

- **Loss \mathcal{L} :** nonnegative measure of the discrepancy between expected output $\hat{\mathbf{y}}$ and obtained output \mathbf{y} .
- **Example:** output should be [0, 1] but is [0.2, 0.8].

Parameters

- $f = f_w$ contains **parameters \mathbf{W}** to be trained,
- In most cases, an ideal f_w exists but is **hard to find in practice**,
- Learning is a **regression ill-posed** problem.

Global formalism

- Loss: $J(\mathbf{W}) = \sum_i \mathcal{L}(f(\mathbf{x}^{(i)}, \mathbf{W}), \mathbf{y}^{(i)})$, $i = \text{examples}$
- Model parameters: $\mathbf{W}^* = \text{argmin}(J(\mathbf{W}))$

Training Algorithm

- Randomly Initialize model weights
- Compute Gradient of the Loss $\frac{\partial J(\mathbf{W})}{\partial \mathbf{W}}$
- Update weights
$$\mathbf{W} \leftarrow \mathbf{W} - \eta \frac{\partial J(\mathbf{W})}{\partial \mathbf{W}}$$
- Repeat until convergence

Deep learning

Main idea

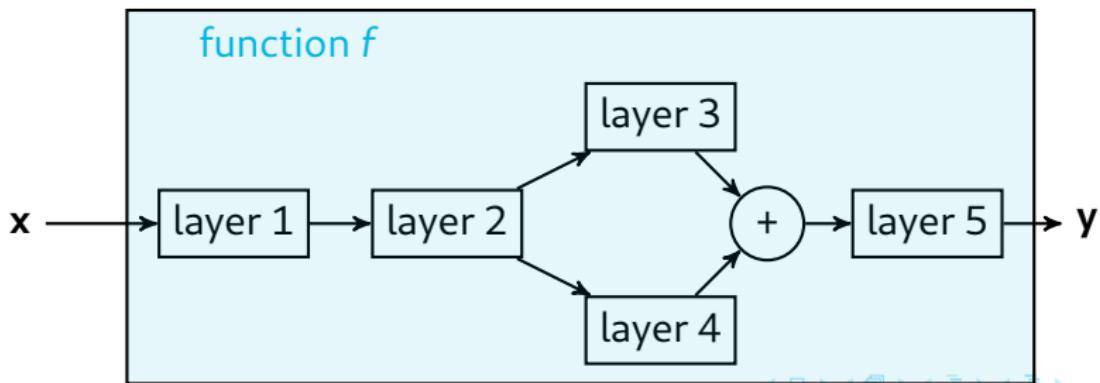

- **Compositional Approach:** Instead of directly mapping x to y , express solutions as an assembly of simple mathematical functions called **layers**
- **End-to-end learning:** Tune all atomic functions together
- **Training:** Backpropagate throughout the architecture (to compute the gradient of the loss wrt all layers parameters)

Deep learning

Number of layers, choice of the architecture are **hyperparameters**

Layers

- $\mathbf{x} \mapsto h(\mathbf{W}\mathbf{x} + \mathbf{b})$.
 - h is a nonlinear parameterwise function (often without parameters),
 - \mathbf{W} is a tensor:
 - Can be agnostic of the structure: fully-connected layers,
 - Can be structure-dependent: convolutional layers.

Layers

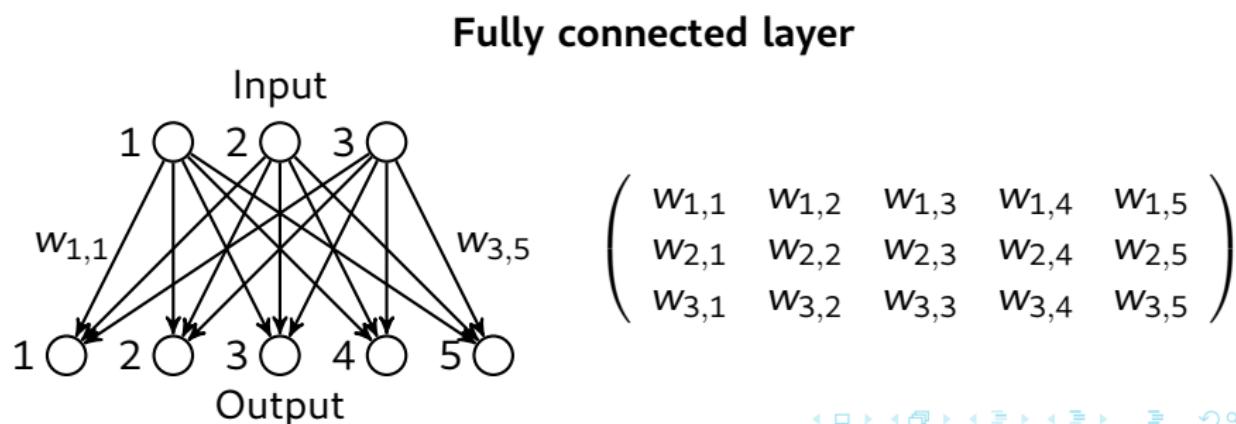

- $\mathbf{x} \mapsto h(\mathbf{W}\mathbf{x} + \mathbf{b})$.
- h is a nonlinear parameterwise function (often without parameters),
- \mathbf{W} is a tensor:
 - Can be agnostic of the structure: fully-connected layers,
 - Can be structure-dependent: convolutional layers.

Layers

- $\mathbf{x} \mapsto h(\mathbf{W}\mathbf{x} + \mathbf{b})$.
 - h is a nonlinear parameterwise function (often without parameters),
 - \mathbf{W} is a tensor:
 - Can be agnostic of the structure: **fully-connected layers**,
 - Can be structure-dependent: **convolutional layers**.

Layers

- $x \mapsto h(\mathbf{W}x + \mathbf{b})$.
 - h is a nonlinear parameterwise function (often without parameters),
 - \mathbf{W} is a tensor:
 - Can be agnostic of the structure: **fully-connected layers**,
 - Can be structure-dependent: **convolutional layers**.

Some additional details

 - \mathbf{W} is a tensor:
 - Can be agnostic of the structure: **fully-connected layers**,
 - Can be structure-dependent: **convolutional layers**.

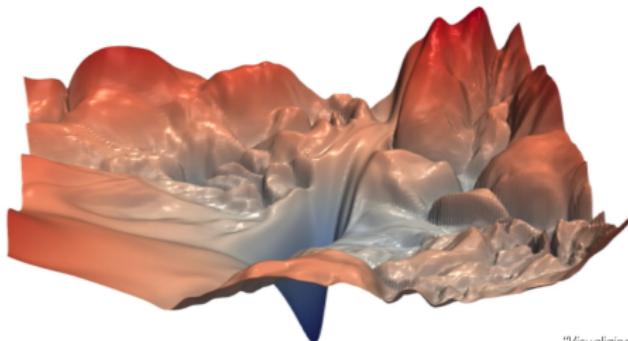

Convolutional layer

$$\left(\begin{pmatrix} w_7 & w_8 & w_9 & 0 & 0 & 0 \\ w_4 & w_5 & w_6 & w_7 & w_8 & w_9 \\ w_1 & w_2 & w_3 & 0 & 0 & 0 \\ 0 & w_1 & w_2 & w_3 & w_4 & w_5 \\ 0 & 0 & w_4 & w_5 & w_6 & w_7 \\ 0 & 0 & 0 & w_1 & w_2 & w_3 \end{pmatrix} \right)$$

Some additional details

Training Neural Networks is Difficult

"Visualizing the loss landscape of neural nets". Dec 2017.

Optimization with Differentiable Algorithmic

- Learning rate η : $\mathbf{W} \leftarrow \mathbf{W} - \eta \frac{\partial J(\mathbf{W})}{\partial \mathbf{W}}$
- Variants of the **Stochastic Gradient Descent (SGD)** algorithm are used:
 - Use of **moments**,
 - Use of **regularizers**.

Training Neural Networks is Difficult

"Visualizing the loss landscape of neural nets". Dec 2017.

Batches

- To accelerate computations, inputs are often treated **concurrently** using small **batches**.

Generalization vs Overfitting

Learning Objectives

- Reduce the training error AND reduce the gap between training and **generalization error** (error on new inputs)
- Avoid **overfitting**, increase generalization for better performances on test set

Validation Set

- Examples from the training distribution NOT observed during training (e.g. 20%, 80% split) to check model generalization

Generalization vs Overfitting

Learning Objectives

Validation Set

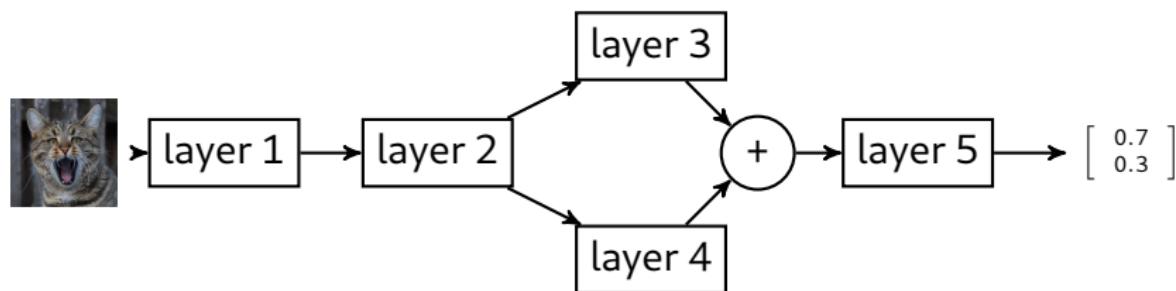

- Examples from the training distribution NOT observed during training (e.g. 20%, 80% split) to check model generalization

The case of deep learning in classification

Inputs/outputs

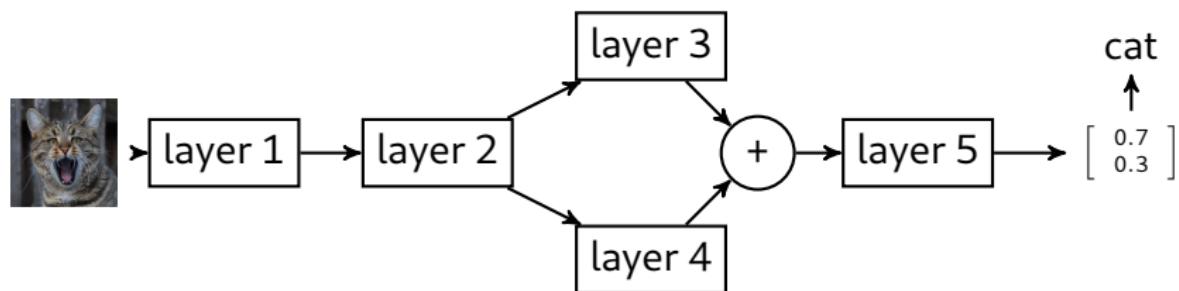

- Often: inputs are **raw signals** or **feature vectors**,
- Often: outputs are vectors which **highest value** indicate the **category of the input**.

The case of deep learning in classification

Inputs/outputs

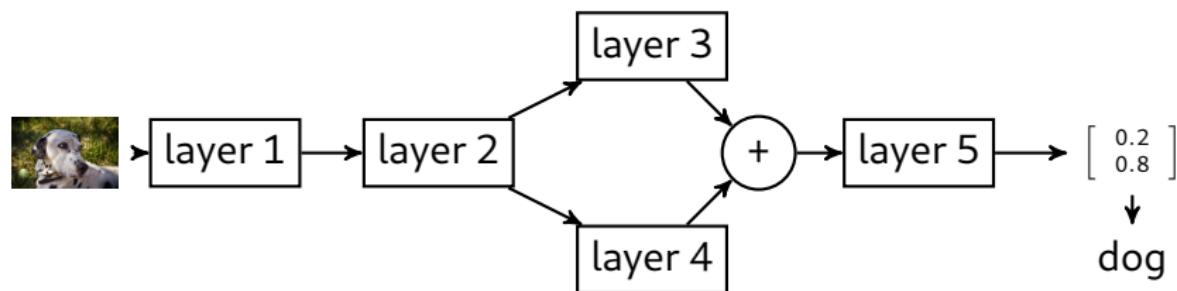

- Often: inputs are **raw signals** or **feature vectors**,
- Often: outputs are vectors which **highest value** indicate the **category of the input**.

The case of deep learning in classification

Inputs/outputs

- Often: inputs are **raw signals** or **feature vectors**,
- Often: outputs are vectors which **highest value** indicate the **category of the input**.

Loss and targets

- Labels are encoded as one-hot-bit vectors and called **targets**,
- Outputs are softmaxed: $y_i \leftarrow \exp(y_i) / \sum_j \exp(y_j)$,
- Loss is typically cross-entropy: $-\log(\hat{y}^\top y)$.

The case of deep learning in classification

Inputs/outputs

- Often: inputs are **raw signals** or **feature vectors**,
- Often: outputs are vectors which **highest value** indicate the **category of the input**.

Loss and targets

- Labels are encoded as one-hot-bit vectors and called **targets**,
- Outputs are **softmaxed**: $\hat{\mathbf{y}}_i \leftarrow \exp(\mathbf{y}_i) / \sum_j \exp(\mathbf{y}_j)$,
- Loss is typically **cross-entropy**: $-\log(\hat{\mathbf{y}}^\top \mathbf{y})$.

- Outputs are **softmaxed**: $y_i \leftarrow \exp(y_i) / \sum_j \exp(y_j)$,
- Loss is typically **cross-entropy**: $-\log(\hat{y}^\top y)$.

Transfer Learning and fine-tuning

Idea: use **feature vectors** from a **backbone** (pretrained) network to train a **downstream** classifier.

Two usecases

- **Fine-tuning:** both the backbone and downstream networks are trained,
- **Transfer Learning:** Only the downstream network is trained.

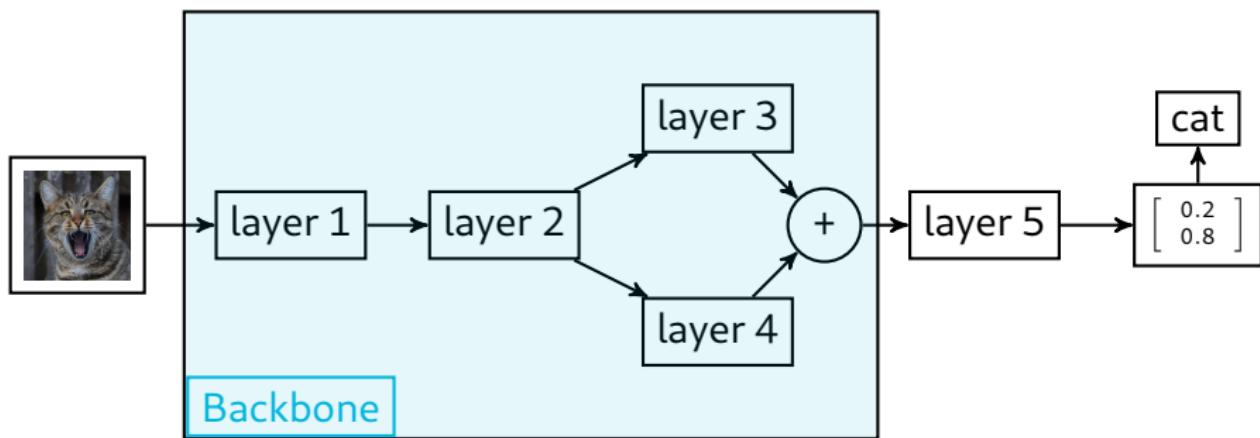

Transfer Learning and fine-tuning

A focus on VGG

Lab Session 1 and assignment

Introduction to Deep Learning

- Introduction to Deep Learning in Pytorch
- Train a full DL model from scratch
- Train a downstream model using transfer learning

Project 1 (oral presentation)

Explore one of the following architectures : ResNet, DenseNet, PreActResNet, VGG.

You have to prepare a 10 minutes (+5 min Q&A) presentation for session 3, in which you explain :

- Description of the architecture
- Hyperparameter search and results
- Study the compromise between architecture size, performance and training time.
